ABSTRACT

A study examined Job Corps vocational education offerings and outcomes during fiscal year 1982. The focus of the study was on the amount, type, and quality of vocational training provided to disadvantaged youth between the ages of 16 and 21 throughout the United States. Included in the study were Job Corps programs in the 50 states as well as in the District of Columbia, Guam, Puerto Rico, and the Virgin Islands. Of these, 10 were without a Job Corps center and another 17 had only one center. Job Corps training centers provided job training in 122 occupations to corpsmembers in fiscal year 1982. Based on data for over 32,000 corpsmembers who remained in the program for 90 days or longer, the program had a 53.6 percent job placement rate. In fiscal year 1982, vocational training was provided to Job Corpsmen by 75 regular contract centers, 30 Civilian Conservation Centers administered by the Department of Agriculture, and 10 national contractors. A series of Job Corps training guides was used to standardize vocational training provided throughout the country, and a competency-based curriculum was tested in 1982 as a possible vehicle for greater standardization of programs throughout the country. (Fifty-seven tables are included in this report and its appendix.) (MN)

I-D-1 An Illustrative Listing of FY 1982 Job Corps Vocational Training Offerings Showing Step-off Levels 148

I. Introduction

Perhaps it would be best to begin this examination of Job Corps FY 1982 vocational education performance by specifying what it is *not*. It is *not* an assessment of the overall effectiveness of the Job Corps.1/ It is an attempt to identify relative differences in vocational training component efficiencies. Ideally, *efficiency* would be defined in terms of the contribution to Corpsmembers' post-program "success" in the labor market per unit of dollars invested in vocational training, where "success" means increased earned income over what it would have been absent program participation, and vocational *training components* are defined as those major variables used in producing training: Occupations, vendors (organizations or categories of organizations providing training), pedagogical techniques.

It is recognized that "program success" might be judged more broadly to include "other positive outcomes" (*e.g.*, return to school) rather than only "going to work." Secondly, other aspects of the total Job Corps experience *may* be just as influential (or more?) as the particular vocational preparation received by the Corpsmember.

While there is no disagreement with assessing every reasonable benefit, economic and "noneconomic" (*e.g.*, enhancements to educational attainment, personal health, self-image) in assessing the overall effectiveness of the Job Corps as an element of public human resources policy, most such other positive outcomes are inherently difficult to

---

1/ For an overall evaluation of the Job Corps see Charles D. Mallar, *et al.*, *Evaluation of the Economic Impact of the Job Corps Program: Third Follow-up Report*, Mathematica Policy Research, Inc., Princeton, N.J., September, 1982.

center level with trainee outcomes. There was no examination of curricula, teaching techniques, or instructional personnel. And finally, there is considerable doubt as to the direct comparability of skill levels imparted in training courses (at different centers, etc.) bearing the same occupational title.

Some of these shortcomings could be remedied in future iterations of a study such as the present one, given longer lead time and more meticulous attention to research design. Some could not.

But, if there are shortcomings, much light is shed on Job Corps vocational offerings in the following pages. The next (second) section describes the geographical distribution of Job Corps centers and enrollees, characteristics of Corpsmembers upon enrollment, and Corpsmembers' geographic mobility. The third section summarizes the vocational training accomplished in FY 1982. It includes the most definitive specification of occupations of training possible without on-site examination, both as generalized in the Job Corps occupational cluster structure reflected in the MIS and by D.O.T. title as could be identified in the Cost Survey. The fourth section presents data on outcomes (short-term) by occupation. The fifth section compares performance of national contractors with Job Corps Centers and Civilian Conservation Centers (CCC) as providers of training. The sixth and final section presents information on current center practices in use of "step-off" levels with those Corpsmembers who do not complete the curriculum to more advanced vocational competencies.

The data appearing in this study are revised from the regular Job Corps MIS data base. Earlier analysis of the occupational training provided in FY 1982, from the MIS, were inconsistent with the occupations of training centers had reported separately in a vocational training cost survey. The inconsistencies appeared to stem in large measure from errors in the occupational coding of individual Corpsmembers. Consequently, in the summer of 1983 Job Corps Centers were requested to review, correct, and reconcile their FY 1982 vocational training occupations and costs, with verified or corrected occupational coding of each terminee from their center. Extensive instructions, forms, an amended Job Corps Occupational Structure, and computer print-outs of all FY 1982 terminees showing currently assigned occupational codes were sent to the centers via Job Corps Notice No. 83-39, dated June 13, 1983. By mid-August, 99 out of 103 centers in operation all of FY 1982, had completed the arduous verification and correction tasks and validated data were transmitted to the MIS facility. These revised data, which preclude development of some useful outcome variables such as "job training match," are used throughout this report.

While the occupational titles of the Management Information System (MIS) are specified in the Job Corps Occupational Training Classification Structure, the occupations to which they apply are in some instances referred to in this report by other names. The names used are for the convenience of the program review team and do not constitute replacements for existing MIS titles. To minimize confusion between MIS and convenience titles, a cross-referencing of such terms follows. Occupational titles have been shortened or otherwise modified for ease of communication and/or clarity. These differences are generally self-evident but are shown in the table regardless of how slight the modification.

Cross-Referencing of Occupational Titles

CONVENIENCE OCCUPATIONAL TITLE	MIS OCCUPATIONAL TITLE
Carpenter	Carpenter, Construction
Cashier	Cashier/Checker
Engineering Aide/Rodman	Engineering Aide/Rodman-Chainman
Heavy Equipment Repair (er)	Repairman, Heavy/Heavy Equipment Repair
Hospital Dietician Aide	Tray-Line Worker/Hospital Dietician Aide
Landscaper	Nursery Worker, Landscape Assistant, Groundskeeper
Machine Operator (Set-up)	Machine Operator/Machine Set-up Man (multiple machines)
Machine Operator (Lathe)	Machine Operator, Single--Lathe
Painter	Painter-Paperhanger
Physical Therapy Aide	Attendant, Physical Therapy/Physical Therapy Aide
Professional Program Aide	Professional (Program Aide)
Truck Driver	Truck Driver, Heavy/Light
Warehouseman	Warehouseman, Hand
Welder, Gas	Welder, Gas Metal Arc (MIG/TIG)

II. Geographical Distribution of Job Corps Centers and Corpsmembers and Their Characteristics

The geographic location of training offered vis a vis the place of ultimate residence of enrollees is of major importance in aligning training to labor market demand.

All told, ten of the 54 "states" (including the District of Columbia, Guam, Puerto Rico, and the Virgin Islands) were without a Job Corps center in FY 1982. (See Table I-A-1, attached, for a listing of all centers by D.O.L. region and state.) Another 17 states had only one center, in five of which it was a Civilian Conservation Center (see following Table A). Forty-three centers, two-fifths of the total of 105, were located in just nine states. Eleven states had 39 (over half) of the 75 Contract Centers, while the 30 Civilian Conservation Centers (CCC's) were found in 19 states, leaving 35 states unrepresented.

All centers were not the same size, and young people from all but one state -- Alaska -- enrolled in Job Corps.[2/] Enrollments do not follow state center distribution. Enrollment capacity does vary widely, even by D.O.L. region. While each region had at least two Contract Centers, two (I Boston and IX San Francisco) had no CCC's. On the other hand Region IV Atlanta had 15 Contract Centers and 7 CCC's. The following table (Table B) shows the authorized enrollment capacity in each region.

The Bureau of Labor Statistics produced, for this study, rough estimates of the "universe of need" for Job Corps-like program services, using data tabulated from the March 1982 Current Population Survey. The specifications for the estimates and the data are included as Table I-A-1.01. In order to differentiate the need for predominantly residential Job Corps-type programs from programs directed to all "economically disadvantaged" youths (column 2 of the BLS estimates), only the data reflecting assumed deprivation of education and/or family life among youth in poverty (columns 3, 4, & 5) are used for the more conservative estimates of need shown on Table B. A cautionary note is warranted. The specifications of "deprivation" used (the options are limited by the nature of the CPS data

X	200	129,000	3.1	2,482	6.2	962	2.8	1,520	23.4

[1] Source: BLS (See Table I-A-1.01) Universe of Need estimates exclude Puerto Rico and the Virgin Islands in Reg. II and Guam in Reg. IX.

[2] 100 means capacity "equal" to universe of need given the National capacity of 40,315 vs. Universe of Need of 4,119,000.

[3] Enrollment capacity actually 56 fewer than authorized because of temporary facility limitation at Iroquois, NY, CCC.

base) are rather broad and may produce misleading results. A more refined (and lengthy) analysis might produce rather different estimates of need.

Notwithstanding, the universe of need estimates disclose a considerable geographic disproportionality, regionally, between enrollment capacity and "need." "Need" should not be translated directly into "demand." It is possible that youthful women and men (and their families) in some parts of the country may be less inclined to "go live in a Job Corps center" than those in other parts. Thus, "demand" for Job Corps enrollment may be somewhat greater or less than is indicated by estimates of "need."

As shown in Table B, six regions have a substantial difference (greater than 20%) between capacity and need, with one having less than half the capacity it "needs" and two having twice as much or more than their proportional share. Again, it is to be noted that this analysis is based only on the existing levels of national capacity (40,315 in 1982) and estimated need (4,119,000), and says nothing about the adequacy of enrollment capacity even in Region VIII which has over three times its share of existing national capacity in relation to its "need."

This disproportionality in center capacity has resulted in considerable interregional recruitment/assignment of Job Corps enrollees (see Table I-A-2.00 through I-A-2.10, attached), and substantial enrollment of Corpsmembers in centers located outside their home state. As shown in Table I-A-2.04, for example, there is a great volume of interstate assignments in the region with the most Job Corps centers and enrollment capacity.

The following table (C) summarizes the number of states, by region as to the percentage of Corpsmembers enrolled in centers within the state who are residents of the same state. Aside from the 10 states without centers, which obviously do not enroll any residents, in Job Corps centers in 19 states fewer than 50 percent of the enrollees are residents of the state in which they are enrolled. In only 8 states do state residents account for 90 percent or more of all enrollees.

Moreover, the dispersion of enrollees by state of origin appears quite large. Centers in only 5 states (Puerto Rico, Minnesota, Louisiana, Iowa, Arizona) enroll Corpsmembers virtually exclusively from their own state (i.e., fewer than 10 enrollees from other states). In 2 other states, Job Corps Centers drew more than 10 enrollees from only one non-resident state. At the other end of the spectrum, centers in 18 states (41 percent of states in which centers were located) enrolled at least 10 Corpsmembers from each of 5 or more non-resident states or regions (See Table D).

All told, a little over one-half of the FY 1982 enrollees were assigned to Job Corps Centers in their home state (See Table E). Three regions had about three-quarters of their enrollees in their states of residence while in two more the proportion was about two-out-of-three. In two other regions the proportion of home state enrollees was about 50-50, in two more it was only two-of-five, and in one region fewer than one-fourth of the enrollees were in centers in their home states.

The interregional movement, not large overall, is considerable in a number of regions, amounting to more than 10 percent (imports or exports) in four regions.

Table C. State in Which Job Corps Centers Enroll Residents of the Home State, by Percent of Enrollee Residents and Region, FY 1982

Region	States with enrolled residents: Percent				
	0	0.1 to 20	20.1 to 50	50.1 to 90	90.1 to 100

VIII	2	1	2	1	0
IV	1	0	1	0	3
X	1	0	2	1	0

Turning to where former Corpsmembers go to live when they leave Job Corps, it is reported that almost 15 percent relocate to a new commuting area instead of returning to their earlier residences. Table I-A-3.01, attached, presents the data for all regions and categories of terminees. As a generalization, the longer an individual stays in Job Corps, the greater her/his tendency to change residences. The largest proportion of relocatees is reported by Region VIII where 30 percent of terminees contacted had left their former home towns. Six regions reported that one-out-of-eight former Job Corpsmembers were seeking (or had found) employment in a labor market other than the one in which they resided when they entered the Job Corps.

These findings are generally supported by mobility observations of a sample of Job Corps' 1977 enrollees, who in post-enrollment follow-up interviews told Mathematica Policy Research, Inc. (who were performing an evaluation of Job Corps under contract with ETA) whether or not they had moved to a different city. The results, shown in attached Table I-A-3.02, indicate that at that time some 9 percent of all terminees were relocating and that 17 percent of completers relocated.

Of the 52,902 recorded new enrollees in Job Corps during FY 1982, 62 percent were male and 38 percent were female. Nationwide, 30 percent were white, 55 percent black, 8.2 percent hispanic, 3.6 percent American Indian, and 3 percent Asian and Pacific Islander. Fifteen-to-seventeen year olds and 18-19 year olds each made up slightly under 40 percent of the enrollees, while those in their twenties (20-21 years) accounted for about 22.5 percent. Nineteen percent of the enrollees

Table D. States with Job Corps Centers in which 10 or More Corpsmembers Came From Another State or Another Region, FY 1982

Region	Number of States with Job Corps Centers	Number of states from which non-resident Corpsmembers were enrolled (other region(s) counted as 1)					
		0	1	2	3	4	5 or more

X	2,966	1,201	40.5	26	0.9	529	17.8

had completed 12 or more years of schooling -- and a similar percentage could read at over the 8th grade level. While only 4.7 percent had completed 7 or fewer grades of school, over half could not read at the 7th grade level. With the median school years completed at 10, the median grade reading level was about 6. (See Tables I-B-1 and I-B.2.01 through I-B-2.10, attached.)

A slightly higher percentage of males were teenagers then females, and a considerably greater proportion of females were black. In general, the girls had more formal education and could read better.

The characteristics varied considerably by region of enrollment (not necessarily of original residence) as shown in the following table (Table F).

In two regions (VII and IX) female enrollments made up about one-half the total and in two others (VIII and X) they only constitute about one-fourth. The other six vary rather narrowly around the national average of 38 percent. Interestingly, the outliers are all in the mid-to-far west. The age distribution of enrollees is not so wide, with regions I, II, III and VI tending to enroll somewhat younger Corpsmembers while in regions IV, V and IX the enrollees are a little older, on the average.

Race/ethnic enrollment patterns seem generally to follow regional population patterns. Blacks amounted to 4-of-5 and 3-of-4 enrollees in regions IV and III, respectively, where they constituted the overwhelming majority of minority enrollees. Blacks were about 1-of-4 enrollees in region I, 3-of-10 in IX, 1-of-6 in VIII and only 1-of-8 in X where enrollees were predominantly white males.

Table F. Selected Characteristics of New Job Corps Enrollees, FY 1982 by Region of Enrollment, and by Contract Centers and Civilian Conservation Centers

Region	Female %		Age -- %			Race/Ethnic -- %				Highest School Grade Completed			Entry Reading Level		
			15-17	18-19	20-21	Black	Hispanic	Am. Ind. Asn./Pc.		% 1-7	Approx. Median	% 12+	% 6 or less	Approx. Median	% over 8

Civilian Conservation Centers	9.9		40.8	38.5	20.7	41.7	5.0	5.7		3.7	10	13.9	17.7	7	25.2

Hispanics accounted for their largest proportion of enrollment, 1-of-4, in region IX, where American Indians/Asian and Pacific Islanders (mostly the latter) were second largest at 18.3 percent. Hispanics were also a sizeable proportion of enrollees in region VI; there too, American Indians made up about two-thirds of the almost 1-in-10 enrollees in the American Indian/Asian-Pacific Islander groups. Regions II and VIII also enrolled significant proportions of Hispanics and in region VIII the largest proportion of minority enrollees were American Indians, 22.5 percent.

With the national average at 30 percent white enrollees, two regions (X and I, respectively) had 70 percent and 62.8 percent whites, and four had fewer than 25 percent (IV, VI, II, and III). (See Tables I-B-2.01 to 2.10 for detail not in text table.)

In terms of level of education, there was fairly wide variation among the regions, running from half-again the proportion of enrollees who could read at over the 8th grade level (regions VIII, I, and IX) to more than one-third fewer (region IV). Conversely, regions IV and VI enrolled substantially greater proportions of youngsters who could not read at the 7th grade level, and regions X, VIII, I, and IX substantially smaller proportions. These observations are broadly consonant with school years completed.

New enrollees in CCC's were disproportionately male (90.1 percent), while the Contract Centers were beginning to approach equality, with 43.5 percent women (See Table F). The nonresidential component of the contract center group, (See Table I-B-1) which enrolls proportionately more women than men (12% of all female enrollees were nonresidential compared to 5.4% of male enrollees) accounts for some of the huge difference between CCC's and Contract Centers, but not nearly all. In the residential component only, Contract Centers still enrolled over 36 percent females.

Contract center enrollees were slightly older than CCC enrollees on the average, 23 percent age 20 or 21 years as against 20.7 percent. Here again, the nonresidential component was a factor, as relatively more of the residential Corpsmembers were ages 19, 20, or 21 than were residential enrollees; this age difference was more pronounced among female enrollees than among males.

Again, Contract centers enrolled significantly larger proportions of minorities than the CCC's. Blacks constituted 57.1 percent of Contract Center enrollees and only 41.7 percent of those in CCC's. For Hispanics the numbers were 9.5 percent vs. 5.0 percent, and for American Indians and Asian and Pacific Islanders 7.1 percent vs. 5.7 percent.

Educationally, the CCC's and Contract centers were on par with each other. A smaller fraction of CCC enrollees had completed 1 to 7 years of school and 12 or more years, with a greater proportion near the norm of 10 years for both CCCs and Contract Centers. On reading levels, however, the situation was just the reverse. CCC enrollees were somewhat in front of their Contract Center counterparts with one-in-four reading at better then the 8th grade level -- as against less than one-in-five at Contract Centers. An average of 4.5 out of ten read at the 6th grade level at both CCC's and Contract centers.

III. Vocational Training Offerings in FY 1982

Job Corps provided training in 122 occupations to Corpsmembers who left the Job Corps in FY 1982, as identified in its management information system (MIS). Of these, 80 occupations, each with 25 or more terminees, were reported to have been the principal training activity of Corpsmembers who stayed in Job Corps for at least 90 days. The 80 occupations with at least twenty-five 90 day-or-more terminees are the focus of the analyses throughout the Vocational Offerings Review Project (See Table I-C-1.01). The other 42 occupations identified each produced fewer than 25 terminees who were not early drop outs. There were also seven, listed in the MIS as "other" in major occupational clusters, in which relatively few terminees had been trained. (See Table I-C-1.02 which shows occupations with fewer than 25 90 day-plus terminees; two occupations not shown -- Machine Operator, Drill-Press and Police Officer -- each had one or more terminees who had left the Job Corps before 90 days.) Additionally, there were 14 occupations in which training was reported to have occurred in FY 1982, but which produced no FY 1982 terminees.[1/]

The analysis in this report was limited to terminees who had stayed in Job Corps at least 90 days for two reasons, in addition to the fact that Job Corps has traditionally considered persons who did not stay 90 days as "early leavers" and has that parameter built into the data system. First, early leavers, whose average duration of enrollment is 1.2 months, most frequently have not been in vocational training long enough to get much benefit from it. Second, Centers are not required to identify the occupational training in which early leavers were engaged if they deemed the short exposure

---

[1/] Electrical Technician, Transcribing Machine Operator, Criminal Justice, Other Service Occupations, Fisherman, Truck Farmer, Meat Packaging, Bowling Machine Mechanic, Tester (System, Electric), Dental Laboratory Technician, Occupational Therapy Aide, Renal Dialysis Aide, Surgical Technician, and other Health Occupations.

of little value; since practice appears to vary among Centers on assigning occupations to early leavers, including them would have introduced an unknown variable into the base data for computing occupational job placement rates. The limitation of analysis to occupations with 25 or more trainees was to assure a minimal number for statistical analysis. The data for regional performance include occupations with 10 or more trainees in a region. The national data (25 or more) analysis is the foundation for decisionmaking while the regional information is for internal comparison and guidance; thus the statistically more adequate minimum of 25.

More than 32,000 Corpsmembers who stayed in Job Corps at least 90 days, received training in one of the 80 occupations from which there were 25 or more terminees. While some 41,350 FY 1982 terminees received occupational training, over 9,000 had been enrolled less than 90 days or were in very small or unidentified occupations. Table G (following) shows Corpsmember terminees trained by major occupational cluster. Almost one quarter of all trainees in the 25 or more occupations and 90 day-plus enrollment categories (hereinafter called the "trainees") were in the Construction Trades. The second largest category was Clerical and Sales with about 20% of all trainees. Industrial Production accounted for one out of eight trainees while Health Occupations, Automotive and Machine Repair, and Food Service each had roughly a tenth, followed by Service Occupations at seven percent. The least amount of training was in Electrical/Appliance Repairs, Forestry, Farming, Gardening, (Sub-Professional), and Transportation with less than two percent.

Table G. Training Occupations of Job Corps Terminees, FY 1982, Major Clusters

11. Health Occupation	3,410	10.6	1,049	64	4,523	10.9

Just as Job Corps training was concentrated in a few major clusters, so it was concentrated in a few principal occupations within those clusters. Table H lists the largest training occupations, those from which 300 or more Corpsmembers terminated, the number trained and job placement rates, by sex. There were 22 occupations in which 300 or more -- approximately one percent of the total -- were trained. These 22 occupations accounted for 83.8% of those trained, almost six of every seven corpsmembers. In fact, the Job Corps training was even more concentrated occupationally than those figures indicate. The eight top occupations, each over 1,300, accounted for 18,568 trainees, 58% of the total.

Moreover, the training of women was even more concentrated in a few occupations than that of men. Over 47% of female corpsmembers were trained in 2 occupations -- Clerk-Typist and Nurse Assistant. Add cook, and the three largest female training occupations reaches 56% (See Table I, following). Further, Job Corpswomen tend to be trained in occupations in which trainees are predominantly females. However, a relatively large percentage of women in Job Corps were trained in non-traditional occupations; i.e. they comprised 38% of the electronics trainees, 18% of the painter trainees, 12.8% of the electrician trainees, etc.

Among the 22 "large" training occupations, 6 were composed predominantly of female trainees, 12 were predominantly male, and 4 were relatively balanced (See Table H). These 22 occupations accounted for 9,191, or 82.2%, of women trainees and 17,560, or 65.6$, of male trainees, in occupations/training providers for which sex of trainee was available.

The designations of occupations as "predominantly male" or "pre-

**Includes two small occupations for which sex of trainees was not available.

[1/] Predominantly female means proportion of femans ≥ 52.6%.
Predominantly male means proportion of females ≤ 17.5%.
Relatively balanced means proportion of females was 17.6% - 52.5%.

dominantly female," were determined by applying the following criteria: Occupations in which the trainee population equaled or exceeded 50% more females than their proportion among all trainees in this study were designated "predominantly female." Occupations in which the trainee populations equaled or were less than 50% or fewer females were designated "predominantly male." Those with female trainee proportions between 50% plus or minus the female average were designated "relatively balanced." The percentage criteria used were: female trainees overall constituted 35.1% of all sex recorded trainees. Predominantly female occupations were those in which the proportion of female trainees equaled or exceeded 52.6%. Predominantly male occupations were those in which the proportion of female trainees equaled or was less than 17.6%. Relatively balanced occupations were those in which the proportion of female trainees was from 17.7% through 52.5%.

Job Corpsmembers in FY 1982 were trained in occupations remarkably aligned with employment growth projections for the 1980s. Attached Table I-C-3 displays the numbers of Corpsmembers trained in Job Corps occupations ranked according to BLS's projected Occupational Employment Statistics employment change 1980-1990 and size of Job Corps occupation. Almost 60 % of all FY 1982 trainees were trained in occupations for which projected OES employment growth was 100,000 or more. Almost 71 % of corpswomen trainees were in this top growth group as were some 54% of male trainees. All told 94% of Corpswomen and 95% of Corpsmen were trained in occupations which were expected to grow by 10,000 or more during the decade of the 1980s.

Table I shows similar data in summary for the 22 "large" occupations in which almost 6 out of 7 Corpsmembers were trained. Twelve of the 22, including 6 of the 8 "largest" occupations (over 1,300 trainees) were in the 100,000-plus job growth group, while only one was below an employment increase of 10,000. Five of the high growth 12 occupations were predominantly female, 6 were predominantly male, and one was balanced. Of the other 10 large training occupations, 6 were predominantly male, 3 were balanced, and one -- Key punch Operator, the only one with a negative employment projection -- was predominantly female. Despite the fact that all 3 of the Job Corps training occupations which were projected to lose employment over the decade were predominantly female, on the whole, Corpswomen were trained in occupations marginally better suited to the job market of the '80s (as construed in this study) than were Corpsmen as over 41 percent of the trainees in the 100,000-plus growth category were women, compared to their 35 percent among all trainees.

The number of Job Corps trainees varied widely by region. As was to be expected, the D.O.L. region with the largest enrollment Job Corps capacity -- Region IV -- had the largest number of trainees -- 8,441. The regions did not follow their enrollment capacity pattern, however, with Region I -- third smallest capacity -- producing the least trainees at 804. The regions varied from 18 to 46 in the number of occupations for which Corpsmembers were trained (see Table K).

All the regions produced trainees in the 8 largest occupations, nationally -- Clerk-Typist, Nurse Assistant, Combination Welder, Cook, Carpenter, Custodial Maintenance, Auto Service Repairer, and Brick/

Table K

Job Corpsmembers Trained and Job Placed by Region, FY 1982

REGION	Number of Occupations[1]	Number Trained	Number Job Placed	Percent Job Placed	Average Hourly Wage	
National Total	80	32,033	14,910	46.5	$4.03	
I	18	804	374	46.5	$3.91	
II	31	1,652	675	40.8	$3.88	
III	44	3,841	1,974	51.4	$3.68	
IV	41	8,441	3,256	38.6	$3.81

VII	23	1,411	711	50.4	$3.75	
VIII	21	2,167	1,045	48.2	$3.91	
IX	46	3,093	1,829	58.8	$4.20	
X	29	2,225	1,255	59.0	$4,35	

1/ National total based on 25 or more trainees in an occupation; regional data based on 10 trainees in an occupation in which training was provided by a Contract Center, a CCC, or a National Contractor.

Stone Mason -- except Region I which did not reach the cut-off level in Carpenter or Auto Service Repairer. Again, Region IV produced the most trainees in each of these occupations, except for Combination Welder in which the second largest Job Corps region, Region VI was the leader (See Tables L-1 through L-8).

Region IX, the top in total number of sizeable training occupations (46) also led with 21 out of 22 of the nationwide largest 22 occupations, missing only Landscaper. Regions III, IV, and VI each had 19 of the big 22, while Region I was low with 10. The other regions each had 14-16 (Table M).

IV. Outcomes

Job placement following the training experience in Job Corps, is the most important short-term output as an indicator of long term program "success." Research findings disclose that the "entered employment rate" is powerfully correlated with long-term increases in earnings for all public employment and training programs, including Job Corps. Thus, job placement and, as shown in a subsequent segment of the report, the training costs incurred in achieving job placement are key measures of training efficiency.

Occupational job placement rates used in this study are the quotients obtained by dividing the number "job placed" by the number of Corpsmembers trained in that occupation who terminated in FY 1982, after at least 90 days in Job Corps. This is not the placement rate normally used to summarize Job Corps results as a whole. Table N shows the national summary Placement Status Report data, as normally used, and the "job placement rate" computed in a manner comparable to the rates for individual occupations in this study. The difference is that the computation conventionally used for national data, does not consider all former corpsmembers who are "unavailable for placement" form the base, whereas the occupational data in this study uses as a base all corpsmembers for whom there is a placement record, even those unavailable for placement. The national average job placement rate comparable to the occupational rates for FY 1982 is 53.6% (stub item 4 in Table N). This contrasts with a conventionally used job placement rate of 57.6% and a total placement rate of 86.7% for that year, both relating to corpsmembers staying at least 90 days.

Table N has been included also to show that the absolute FY 1982 job placement levels reflected in this report were down from previous years. Fiscal year 1978, a year of relatively normal economic activity, was selected for comparison purposes to put FY 1982 performance figures in perspective.

Job Corps is not immune to the economic trends of the nation. Placement rates declined in FY 1982 presumably due to the unemployment stiuation. Job Corps enrollees stayed on center for longer periods of time than in previous years. In 1978 the average number of months an enrollee spent in Job Corps was 5.9 months. In FY 1982 the average duration was 8.4 months.

Other enrollment and placement outcomes are indicative of the status of the economy. Table N gives a summary of conventionally derived enrollment and placement data for those corpsmembers who terminated in FY 1978 and FY 1982. As the table shows, the number of terminees with 90 days or more in Job Corps in a fiscal year in-

4. Job Placed as % Number With Placement Record		63.52		53.61

creased from 27,637 in 1978 to 35,720 in 1982, as Job Corps center capacity was increased. The percentage of those whi were placed in a job, school, or military fell in FY 1982 to 86.6 percent. It had been 92 percent in the earlier, more typical year. The conventional job placement rate, not surprisingly, dropped from 68.4 percent in the pre-recession year 1978 to 57.4% in fiscal year 1982.

The purpose of this comparison is neither to defend or criticize the FY 1982 level of performance. The present study seeks to identify internal comparisons only, one occupation or training deliverer vs. another. This diegression is intended to avoid confusion of the casual reader who may recall the conventional placement figures.

The data base used in this study is not identical with the established Job Corps MIS output. As discussed earlier, in the summer of 1983, the FY 1982 Corpsmember terminees records were reviewed and the occupational training they received was verified or corrected. By these revised data, the overall rate of job placement was 46.12 percent for the 32,033 occupationally identified Corpsmembers in this study, which includes total number of terminees. Data for prior years is not comparable, it was based on number of terminees available for placement instead of on the total number of terminees.

As Table 0 shows, occupational job placement rates varied from a high of 88 percent for Electronic Technicians to a low of 18.5 percent for Medical Laboratory Assistants. The highest quarter of occupational job placement rates -- i.e., the top 20 ranging from 58.3% to 88% -- is composed principally of small sized training occupations (only 3 exceeded 100 trainees) and male trainees. One fifth of them had a significant proportion of female trainees and in only two did female trainees predominate.

Table O. Job Placement Rates of Job Corps Trainees, FY 1982, by Occupation, High and Low Quartiles

Job Corps Occupation	Job Placement Rate	Number of Trainees			
		Total	Females Trained In		
			Predominantly Female Occupation	Predominantly Male Occupation	Relatively Balanced Occupation
Electronic Technician	88.0	25			7

Teacher, Nursery School	30.6	124	117		
Duplicating Machine Operator	21.9	73	39		
Mail Clerk	19.7	61	30*		
Medical Laboratory Assistant	18.5	27	na		

At the low end of the job placement ranking, the situation was just the reverse: 11 of 21 occupations in the low quartile -- 43.2% or below -- had 100 or more trainees and 14 out of 20 for which such data are available were predominantly female occupations. Females constituted more than their overall proportion of trainees -- 35.1% in another 3 of the low placement occupations leaving only 3 in which male trainees accounted for the disproportionate share of trainees.

Job placement rates for the 22 largest occupations, over 300 trainees each, which together accounted for 83.8 percent of all trainees, portray the same pattern. None of the large training occupations had job placement rates in the top quartile. Thirteen of the 22 were in the second quartile, with rates from 57% down to 47.1%. None of the "above average" job placement rate occupations among the big 22 were predominantly female and only in 1 were female trainees represented in proportion to their numbers in Job Corps, albeit 2 more were marginally "balanced" occupations (See Table P).

On the other hand, 2 of the 3 occupations with job placement rates just below the overall average (third quartile) were predominantly female; one was predominantly male. The remaining six big occupations were in the bottom quartile. The 10,284 trainees in these low placement large occupations accounted for nearly one-third (32.1%) of all trainees, but the 6,825 Corpswomen trained in them constituted over 3 out of 5 (61%) of all female trainees. Included among this group were the 3 occupations training the largest numbers of Corpswomen, and a majority of the total, Clerk-Typist, Nurse Assistant, and Cook, while only one predominantly male occupation -- Spot Welder -- in the large 22 had such a low job placement rate.

Table P. Job Placement Rates of Job Corps Trainees, FY 1982, 22 Largest Occupations, Ranked by Occupation

	Job Placement Rate	Number of Trainees			
		Total	Females Trained In		
			Predominantly Female Occupation	Predominantly Male Occupation	Relatively Balanced Occupation
1st Quartile - none					
2nd Quartile					
Heavy Equipment Operator	57.0	384		23	
Plumber	54.9	508		18*	
Electronics Assembly	54.0	613			242
Cement Mason	53.7	585		32	
Carpenter	52.7	2,121		163	
Electrician	51.6	793		100*	
Combination Welder	51.5	2,854		183	
Painter	50.6	982			177
Auto Service Repair	50.5	1,334		76	
Auto Body Repair	50.1	841		68	
Auto Mechanic Helper	48.1	674		57*	
Landscaper	47.8	423			83*
Brick/Stone Mason	47.1	1,311		52	
3rd Quartile					
Custodial Maintenance	45.9	1,998		238	
Clerk, General	44.2	678	551		
Retail Sales Clerk	43.6	433	294		
4th Quartile					
Key Punch Operator	43.2	370	277*		
Cook	41.6	2,600			994
Welder, Spot	40.9	631		65	
Bookkeeper	38.3	313	209		
Nurse Assistant	37.9	3,081	2,589		
Clerk-Typist	37.0	3,269	2,691		

* See Note in Table H.

These results are at least partially due to the method of computing job placement rates in this study, as mentioned above. Job Corps' conventional method of computing job placement rates uses, as the base, only terminees "available for placement." Since, historically, many more ex-Corpswomen leave the labor force upon termination than do Corpsmen, the use of all terminees as the computational base, as was done in this study, including both males and females who may have dropped out of the labor force, undoubtedly yields relatively lower job placement rates for females.

V. Comparison of Training Providers

Broadly speaking, there were 3 "kinds" of providers of vocational training to Job Corpsmembers in FY 1982. They were the regular Contract Centers, numbering 75 and providing the training to the most Corpsmembers -- over 23,000; the 30 Civilian Conservation Centers administered by the Department of Agriculture (18) and the Department of the Interior (12), which provided training to about 3,000, the fewest Corpsmembers; and 10 National Contractors, each of which typically provides vocational training to corpsmembers at several centers, although they do operate a few single center programs and two separate centers. National Contractors provided training to almost 5,000 Corpsmembers.

There were 18 occupations for which more than one kind of provider produced trainees: Contract Centers trained in all 18, National Contractors in 15, and CCCs in 9 with 25 or more trainees in each kind/occupation (See Table Q). The 14,807 trainees from Contract Center comparison occupations accounted for about five-eighths of all Contract Center trainees. For National Contractors the 15 comparison occupations accounted for 4,227 trainees, about seven-eigths of their total output. Again about seven-eighths of CCCs total training were in the comparison occupations (2,661).

Table Q. Corpsmembers Trained and Percent Job Placed, by Occupation and Kind of Training Provider of 25 or more Trainees, by Sex, for Occupations for which more than One Kind of Provider Produced Trainees, FY 1982.

Job Corps Occupation with more than one Training Provider	Total Number Trained	Contract Centers Trainees			Average Hourly Wage	National Contractors Trainees			Average Hourly Wage	Civil Conservation Corps Trainees			Average Hourly Wage

In general, the Contract Centers did less well than either National Contractors or CCCs, in terms of percent job placement. On proportion of female trainees, the Contract Centers did somewhat better than National Contractors and CCCs. The National Contractors had substantially higher job placement rates in all but one occupation (Service Station Attendant) than Contract Centers, more than doubling the latter's rates for Clerk-Typist and Heavy Equipment Repairer. In both of these occupations Contract Centers trained a slightly higher proportion of females.

There were generally substantial differences in the average hourly entry wage paid to job trainees from the different training providers. Trainees of the National Contractors almost across-the-board were paid high wages in their first post-termination jobs. In 13 of the 15 comparison occupations, National Contractor trainees received a higher hourly wage, usually substantially higher -- running over $3.00/hour higher, or almost double, for Clerk-Typist. Only National Contractor trainees in Custodial Maintenance and Service Station Attendant received marginally lower entry wage rates. The entry wage picture was only slightly less advantageous for National Contractor trainees as against those of CCC's in the 6 occupations of comparable training. Only in one, Custodial Maintenance, did they fall a bit below the CCC group.

CCC trainees generally did somewhat better wage-wise than Contract Center trainees, with 3 occupations marginally lower, two about the same and 4 significantly higher. The wage differentials favoring CCC trainees were generally considerably smaller than those enjoyed by National Contractor trainees.

A Caveat

A cautionary note is very much needed, lest hasty -- and at least partially erroneous conclusions are reached on the basis of the foregoing data. All the above observed results, e.g., the differences in job placement rates for female vs. male Corpsmembers, and the differences by occupation, region, and Contract Center/National Contractor/CCCs, are "raw" observations. That is they are not "net" results as might be observed by comparing the experience of the Job Corps trainees to a finely matched control group, nor are they adjusted to neutralize the effect on job placement of the more or less favorable characteristics (e.g., age, education) of the group of Corpsmembers enrolled in each given occupation or region. For example, it is possible that female terminees, who as a group have somewhat lower job placement rates than males, actually achieve greater net gains over those of their peer group who did not enroll in Job Corps, than do male terminees.

The purposes of this study are reasonably served by their raw data, however, as they do show real differences for internal component to component comparisons.

VI. Step-off Practices

A. Background

Job Corps' mission is to assist low-income, disadvantaged youth between 16 and 21 who need and can benefit from an unusually intensive educational and vocational program to become more employable and productive citizens. Traditionally, these persons have been the most disadvantaged youth, typically those who had been alienated from traditional learning systems or otherwise deprived of the opportunity to acquire work skills and enter equitably into the job market.

Because of these factors, Job Corps has been committed to the concept that training has to be systematically planned, coordinated, and flexible enough to meet the individual needs of each corpsmember. Accordingly, a series of efforts has been undertaken to improve the effectiveness of the vocational training program.

In 1968, Occupational Training Guides (OTG) were developed to standardize the minimum levels and types of training that Corpsmembers must accomplish to become employable at minimum entry levels in specific occupational areas. To insure content quality of each training guide, the Dictionary of Occcupational Titles (D.O.T.) was used to define each occupation, and industrial or professional organizations were engaged to review and validate each guide.

In most instances, occupational training guides were available for the occupational training programs offered at Job Corps centers; however, in those cases in which a guide had not been developed centrally, centers developed their own using suggested general guidelines established by the National Job Corps Office. These guidelines provided for consultation with local community resources and use of D.O.T. as a reference. An Occupational Training Guide identified the minimum training requirements for a specific work skill. Centers were instructed to add training elements to the OTG where necessary to upgrade and improve training peculiar to a local or regional area. The expertise of the center vocational staff and other pertinent personnel was also drawn upon to determine the appropriateness and adequacy of the training to satisfy Corpsmembers' needs within their centers. Thus, a diversified approach to instructional curriculum development was encouraged resulting in the adoption of unique training courses in each center within the Job Corps' system.

B. A Systems Approach to Vocational Training

ET Handbook 325 (Occupational Training Guide), which was published and implemented in May 1976, introduced a systems approach to coordinated training in Job Corps. This systems approach directed centers to integrate each training program, in a certain sequence, to insure that they developed the best possible program to fit the needs of their individual clients.

To assist center personnel in establishing coordinated training programs, the Occupational Training Guide (Handbook ET 325) provided information on procedures and guidelines to: (1) analyze vocational curricula so that they reflect training requirements, (2) plan the training, (3) implement the training, and (4) evaluate and, when necessary, modify the training.

The major objective of the guide was to channel the thinking of center personnel toward a systems approach whereby each phase of training was interrelated. Centers were instructed to initiate any and all training plans from the premise that a major vocational program would be taught. Once a decision was made that a particular training offering was feasible, Occupational Training Guides were to be obtained from existing Job Corps records or new ones to be prepared at the center level and approved by the appropriate authority. The OTGs were then used to identify the basic content that must be taught in a course. Vocational instructors used the OTGs as baseline data to develop Occupational Training Plans whereby major course units were identified and sequenced. The major course units were then further sub-divided into instructional sub-units.

Because of this directive, many centers began to structure their vocational training programs around the job cluster approach. This approach fostered clustering closely related occupational titles that had similar attributes, activities, skills, and knowledges into one training program. These closely related occupational titles were further organized in ascending order to indicate increased employability through additional training and experience. Implementing this concept, centers began to identify career "ladders" and "step-off" levels to illustrate the range of occupations for which the major training units could be adjusted to serve Corpsmembers' individual needs.

To implement this systematic approach to training, the Occupational Training Guides (OTGs) were used to develop Corpsmember Activity Guides (CAGs). The CAGs are self-instructional learning activities designed to allow Corpsmembers to progress through a course at their own rate. The difference in Corpsmembers' learning rates requires that training be designed to permit random entry and random exit. This process allows a Corpsmember to enter a course at any time, progress through the course at his or her individual rate of learning and complete the course independently of others.

The instructional content of each CAG is organized in relatively small sequential steps or tasks, each leading to a desired performance skill. Each task/step is built from the preceding activitiy toward the succeeding task and the ultimate training objective.

To evaluate the Corpsmembers' performance and implementation of the training plans, Training Achievement Records (TAR) are maintained.

The TAR provides a summary record of the level of proficiency attained by the Corpsmember and the rate of progress the Corpsmember has achieved. A TAR was developed for each Occupational Training Guide. The TAR is a mandatory base document.

When Corpsmembers terminate from the program, for whatever reason, they may carry with them a personal copy of this record of achievement. This copy documents the training experiences the Corpsmember has had and accurately describes the specific performance capabilities the Corpsmember has attained. A potential employer could profile the learning experience of a Corpsmember to determine his/her capabilities simply by reviewing the TAR. With the approval of the National Job Corps, centers are given the option to substitute other documents for the TAR to record performance evaluations.

In addition to the TAR, the Program Change Control Sheet (PCCS) is used to assist the center in evaluating and modifying its programs. The PCCS is a vehicle for the vocational personnel at the center to identify problem areas on the TARs and make recommendations for program modifications.

C. Competency Based Training

In March 1980, a Job Corps Vocational Improvement Effort (VIE) task force was established to review existing vocational training programs in Job Corps. The task force initiated the revision of ETH 325 Occupational Training Guide and the development of competency based curricula for the following training clusters:

- Business/Clerical
- Building and Apartment Maintenance
- Welding
- Health
- Food Service
- Electronics Assembly
- Carpentry
- Auto Body Repair
- Auto Mechanics
- Diesel Mechanics

These clusters comprise approximately 60% of the vocational training offered in Job Corps. The new curricula is a complete instructional system; it provides lists of competencies to be attained in each program area, instructor's guides, corpsmember activity guides, revised TARs to reflect the list of competencies, and evaluation checks to measure Corpsmember learning. A major goal of implementing competency based training in Job Corps is to provide a standardized core of competencies in each major vocational area.

The development of this standardized core of competencies is an important step forward in the evolution of the Job Corps vocational training program. Job Corps instructors now have a guide to use in conducting their training programs.

Instead of each center being responsible for developing its own program, they are now being provided with an organizing framework regarding what is to be taught. Corpsmembers at all centers will now gain the same basic skills, while centers will retain certain individualized programs reflecting specific needs.

The lists of competencies in the occupational areas have been developed and validated by experts and employers in each field to verify that the skills are necessary for performance of the job. And, since the system contains a standardized list of competencies, Job Corps now has a better mechanism to judge the effectiveness of particular vocational offerings. Yet the system remains flexible; new competencies may be added to existing lists as technology evolves; and regional differences in types of skills needed can also be accommodated.

The new curricula and system is still in the pilot test stage. It will undergo final revision on a cluster by cluster basis, and final products will be disseminated in FY 1985 and 1986.

Competency lists for all Job Corps training offerings are scheduled for development in the next three years.

D. Job Corps' Vocational Programs -- FY 1982

In an effort to determine what the vocational offerings were during fiscal year 1982, major Job Corps center contractors were contacted and a request was made of them to provide the National Office with (1) a list of each vocational program by DOT, (2) a brief narrative description of each occupation, and (3) step-off levels (hierarchical arrangement of skills per occupation that can be adjusted to serve Corpsmember needs to render them employable) for each program if appropriate.

For the most part, contractors responded to the request by reporting the information for each of the centers under their auspices, while other contractors presented a general picture of the training programs offered at their centers rather than a description of individual center programs.

The list of contractor courses and step-off levels is attached as Table I-D-1. The table presents an array of the major occupational training clusters organized alphabetically by contractor. No attempt was made to present a total listing of all of the training programs at each center; a selected group of the major training programs was reported for further study. The data in Table I-D-1 provides a list of courses and step-off levels taken verbatim from the reports of the major contractors. The examination of contractor programs highlighted several issues which need to be addressed.

1. Step-off Levels

Examination of the step-off levels shown in the table reveals a lack of uniformity in step-offs, presumably resulting from absence of standarization in the procedure used by centers to identify step-off levels for their various vocational programs. The following example taken from the Business/Clerical cluster illustrates the type of diversity found in each occupational area. At one Job Corps center a Clerk-Typist 203.362.010 program reported the following step-off levels: General Office Clerk, Receptionist, File Clerk, Mail Clerk. At another Job Corps center the Clerk-Typist 203.362.010 has a step-off level for Switchboard Operator. And at yet another center the Clerk-Typist 203.362.010 program offers step-off levels for the following D.O.T.s: Collator Operator, Data Typist, Dispatcher, Duplicating Machine Operator, Office Helper, Parcel-Post Clerk, Price Checker. One clearly sees that the Clerk-Typist program with the DOT number 203.362.010 is used by centers to provide different levels and types of clerical training. As stated above, a similar problem exists in other vocational program areas. The question arises as to whether this center-specific classification system is desirable. It is quite clear that the National Job Corps had always supported individual programming on the center level; consequently, one could readily anticipate and understand the type of diversity in course offerings that currently exists in Job Corps. Perhaps what seems to be non-existent in Job Corps' vocational program is the systematic definition of what constitutes a program. Examining the examples that were cited earlier, each of the Clerk-Typist programs at the different centers were unique. A Corpsmember who completes a Clerk-Typist program at one center may have a different set of experiences and skills from a Corpsmember who completes a Clerk-

Typist program in other centers. It is reasonable to expect Job Corps trainees to have acquired certain basic skills that are consistent across all Clerk-Typist programs offered in Job Corps.

It appears that in this instance the occupational title of Clerk-Typist is being used as a generic term to group most of the lower level general business and clerical skills. Occupations listed under Clerk-Typist titles should be related and sequenced to indicate occupational enhancement through additional training. These are factors that should be considered when step-off levels are being identified for any occupation. The Clerk-Typist program is used here to illustrate the problem of step-off levels as a major concern for all centers and in most part all occupations.

2. Reporting Variations

Additional problems surfaced as the step-off levels were reviewed more closely. For example, one occupational program was reported with three different DOT codes; consequently, there is an inconsistency in the reporting of DOTs which raises the question about the certainty of skills being provided in the courses. In several instances occupational titles were listed as step-off levels without D.O.T.s codes, therefore, the courses could not be located in the DOT and there was no way to determine what specific skills and/or programs were being offered in those centers.

In other cases, DOT codes were listed for occupational titles that could not be located in the Dictionary. A similar problem occurred when occupational titles and DOT codes listed by the centers were not verifiable in the DOT.

The aforementioned problems suggest that the systems approach designed in Occupational Training Guide 325 did indeed initiate centers' efforts to develop occupational programs with step-off levels. However, it is evident that centers have been encouraged to determine the extent and scope of their programs. Centers have used their own definitions to interpret, conceptualize, and develop major vocational program offerings. As of 1982, there is very little consistency in the type of training, and thus in the knowledges and skills provided in an occupational program with the same DOT title and DOT code. The same occupational program could be completed with as few as two DOT codes and as many as 12 to 14 DOTs. Since the National Job Corps uses DOTs as controlling program identifiers, it appears that some centers attempted to select codes that approximated their training as closely as possible. However, centers have affixed DOT codes to existing course titles that are not in agreement with the DOT. These problems suggest that the National Office must provide some guidance to the centers concerning (1) what constitutes a major vocational program for each of the trades, (2) what are the related occupational titles and how they should be sequenced, (3) what are the acceptable step-off levels if any and (4) what are the conditions for program completion.

The new competency based curricula provides a starting point for the resolution of these issues in the major program areas. The curricula in each occupational area contains a list of D.O.T.s in that cluster, arranged sequentially in order of skill level required. Specific groups of these D.O.T.s will function as step-off levels. In addition, the curricula cross references the competencies that must be learned for satisfactory completion of each D.O.T. or step-off level. Currently, the curricula is in the pilot test stage, and Job Corps instructors are adapting it and in some cases updating it. The competency lists will be available in FY 1985 and 1986, and will be updated on a yearly basis.

Table I-A-1.01 (Page 2)

Specifications for Job Corps universe-of-need-estimate tabulations to be produced from the March 1982 CPS file.

SELECT IF AGE > 13 AND AGE < 22 and POPSTAT^ = 2;

Someone is to be defined as potentially deprived in education if;

age = 19 to 21, last grade completed is less than the 12th
age = 18, last grade attended is less than the 12th
age = 17, last grade attended is less than the 11th
age = 16, last grade attended is less than the 10th
age = 15, last grade attended is less than the 9th
age = 14, last grade attended is less than the 8th

Someone is to be defined as potentially deprived in family life if the family type is anything other than married couple (i.e., male or female householder or a non-family situation).

Economically disadvantaged implies that family income (individual income for unrelated individuals) is below the poverty level.

Regions are to be defined from the state groups identified on the attached sheet, excluding Puerto Rico, Virgin Islands, and Guam.

Three iterations of the table should be done:

1. Weighted counts
2. Horizontal percent distribution
3. Vertical percent distribution
